Erawan

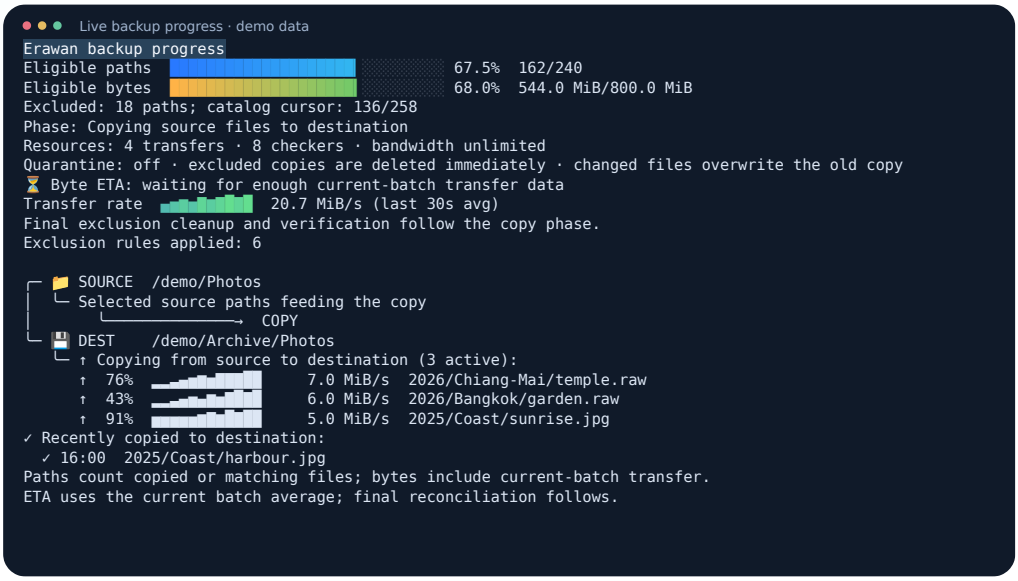

VISUAL · VERIFIED · VERSATILE

See your files move.
Know what was verified.

Visual backups, folder comparison, and reviewed file consolidation.
Follow the bytes, inspect the differences, and choose what to keep.

Endpoint type	From	To	Key detail
Local folders & mounted disks	Yes	Yes*	Includes mounted USB drives & shares
SFTP servers (over SSH)	Yes	Yes	Including one SFTP server to another
Cloudflare R2 & Amazon S3	Yes	Yes	To: a dedicated prefix inside a bucket
SMB, WebDAV & FTP servers	Yes	Yes	Via configured rclone remotes
Running Docker containers	Yes	Yes	Filesystem accessible from this host
Google Drive	Yes†	Planned	Read-only source setup
Other configured rclone remotes	Check	Check	Backend-specific validation needed
Linux SSH peer (rsync mode)	No	Yes	Requires a local source

Backup routes, not an exhaustive tested-pair list. * Local destinations must be below a non-root mount. † Drive source is implemented; verification is in progress. Other workflows have different endpoint support.

Actual progress renderer with demo data. Copying is followed by destination verification.

Back up & watch

Copy to a dedicated local or remote destination. Follow live progress, then check the verification result.

Compare & consolidate

Review selected folders and one KEEP location. Copy missing files and verify retained content.

Find repeated files

Find full-hash content matches across chosen roots. Review kept copies before linking or deleting extras.

Start with a preview

```
erawan wizard
```

Choose your source, destination, and options visually.

Follow a running backup

```
erawan backup watch
```

Follow every file, byte, and verification step.

For Linux. Python 3.10+; rclone for rclone destinations. The rsync-over-SSH mode requires SSH tools and rsync. Development software: run from a source checkout; no packaged release is advertised.

Make room. Bring files together. See what happens next.

VISUAL
Choose in the wizard.
Follow the gradient progress bars.

VERIFIED
Check copied content.
Match duplicates by complete hashes.

VERSATILE
Back up, consolidate, or deduplicate.
Pick the workflow for the job.

01 · Back up & watch

Protect a photo library or copy a server archive. Back up to a mounted USB disk, SFTP server, or cloud destination. Follow copying and the verification result.

A second home for your photos
Photos on laptop → mounted USB archive
Choose → preview → copy → verify
Watch files, bytes, rates, and active transfers.

02 · Compare & consolidate

Bring scattered collections into one archive. Compare an old laptop folder and a USB collection with your chosen KEEP folder. Review missing files and conflicts, then apply.

One KEEP, fewer scattered collections
KEEP: beach.jpg + notes.txt
Old laptop: garden.jpg ↘
USB: birthday.jpg → **KEEP: all four files**

03 · Find repeated files

Find the same content under different names. Scan selected local folders, inspect groups proven by full SHA-256 hashes, and choose the copy to retain before linking or deleting extras.

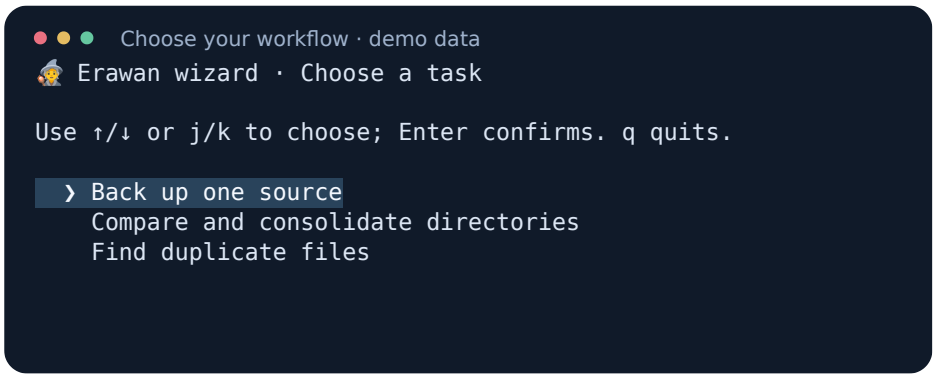

Different names. Identical content.
Photos/beach.jpg
Imports/IMG_0421.jpg
Same full hash → review one group
Choose KEEP; review an action before applying.

Start visually.

`erawan wizard`

Choose a task, then select locations and options with guided menus and browsing.

For backup, review the plan and run commands. For duplicates, choose roots and open the scan review.

Current wizard menu captured from the application's renderer.

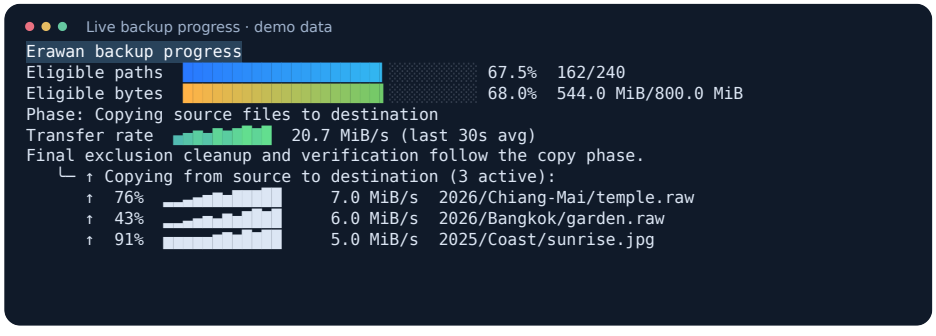

Stay with the job.

`erawan backup watch`

Open a live view of the running backup. Track selected files and bytes, transfer rates, and the files moving now.

Copying is followed by verification. With multiple jobs, add **--job NAME**. Press **q** to leave the watcher; the backup continues.

Paths Bytes

Live-view excerpt from the actual renderer, with demo data. Verification follows copying.
